

METHOD AND APPARATUS FOR AN XML REPORTER

ABSTRACT OF THE DISCLOSURE

5 An invention is provided for generating an XML test result file. A key parameter and a value parameter are received, wherein the key parameter relates to a tag. A first string is then generated based on the key parameter and the value parameter. Included in the first string is a first beginning tag and a first ending tag, each based on the key parameter. In addition, the first string includes the value parameter positioned between
10 the first beginning tag and the first ending tag. The first string is then inserted into a test results file that stores a second string that has a second beginning tag and a second ending tag. In particular, the first string is inserted between the second beginning tag and a second ending tag. By continuing in this manner, an XML test results file can be generated using the embodiments of the present invention.
